EARLY BIRD BODY SYSTEMS TEACHING GUIDE The Body System Series: The Complete Body System Series and Their Functions Having trouble on Biology? Need to find out information about the organ systems and how they work?. This book contains the five different body systems, plus, three more body systems. This is an excellent book if you need, or want; to learn about all the systems of the human body in one go. In this book it contains information on: 1. The Digestive System 2. The Respiratory System 3. The Circulatory/Cardiovascular System 4. The Immune System 5. The Renal System Plus 1. The Endocrine System 2. The Nervous System 3. The Reproductive System This presentation describes various aspects of the regulation of tissue oxygenation, including the roles of the circulatory system, respiratory system, and blood, the carrier of oxygen within these components of the cardiorespiratory system. The respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries. The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection, where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion. Oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate (ATP), the energy currency of all cells. The mitochondria are able to produce ATP until the oxygen tension or PO_2 on the cell surface falls to a critical level of about 4-5 mm Hg. Thus, in order to meet the energetic needs of cells, it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical PO_2 . In order to accomplish this desired outcome, the cardiorespiratory system, including the blood, must be capable of regulation to ensure survival of all

tissues under a wide range of circumstances. The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems, as well as the properties of the blood and parenchymal cells, so that a fundamental understanding of the regulation of tissue oxygenation is achieved. Here's the most entertaining way for children to get a good look at the human body and learn how bodies work: 28 fun and instructive, ready-to-color illustrations. Coordinating text explores the muscular, skeletal, nervous, digestive, respiratory, and immune systems, and answers such questions as What is a hiccup? and Where is my DNA? Offering a student-friendly writing style, this text presents a body systems approach with a strong emphasis on vocabulary and basic anatomy and physiology concepts, as well as the basic mechanisms of disease and pathologic conditions associated with each body system. This comprehensive text is dominated by two unifying themes: the complementarity of structure and function and homeostasis. The integrating principle of homeostasis is used to show how "normal" structure and function is achieved and maintained. Failures of homeostasis are shown as basic mechanisms of disease. The reader is drawn into the subject by superior illustrations, including cadaver dissections, and other student-friendly features. Boxed Essays throughout each chapter contain information ranging from clinical applications to sidelights on recent research or topics related to exercise and fitness. Clinical Applications at the end of each chapter offer short case studies with questions that tie theory to practice, and encourage students to apply their knowledge to specific, practical problems. Answers are in the back of the book. Readability and coverage are at the appropriate level for students approaching the study of anatomy and physiology for the first time, with interesting analogies and examples along with the factual information. Superior art program, with over 450 full-color illustrations, complements text material. Chapter Outlines
